Title	***Reference Design Report for a 60 W Isolated Flyback Power Supply Using InnoSwitch^{TM}3-AQ INN3949CQ***
Specification	50 – 1000 VDC Input; 50 VDC: 4 W 100 VDC: 35 W 200 VDC: 48 W 300 VDC – 1000 VDC: 60 W
Application	High Input Voltage for Automotive Application
Author	Applications Engineering Department
Document Number	RDR-919Q
Date	February 10, 2023
Revision	1.1

<u>**Summary and Features**</u>
- High input voltage: up to 1000 VDC
- Works in extreme hot condition: 85 ºC with continuous 20 W operation at 1000 VDC input
- InnoSwitch^{TM}3-AQ – industry first AC/DC ICs with isolated, safety rated integrated feedback
- Built-in synchronous rectification for >82% efficiency
- All the benefits of secondary-side control with the simplicity of primary-side regulation
  - Insensitive to transformer variation
  - Extremely fast transient response independent of load timing

Table of Contents

Important Note:

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using a high voltage DC Supply to provide the DC input to the prototype board.

1   Introduction

This engineering report describes a 50 VDC to 1000 VDC input, 24 V output, 60 W power supply utilizing INN3949CQ from Power Integrations. The document contains the power supply specification, schematic, bill-of-materials and basic performance data.
Figure 1 – Populated Circuit Board Photograph, Top.
Figure 2 – Populated Circuit Board Photograph, Bottom.

2   Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
Input						
Voltage	V_{IN}	300	800	1000	VDC	For Electric Vehicle Emergency PSU. For 60 W Output Power.
No-load Input Power				30	mW	
Output						
Output Voltage	V_{OUT}		24		V	±5%
Output Current	I_{OUT}		2.5		A	
Output Ripple Voltage	V_{RIPPLE}			240	mV	On Board. (V_{IN} 300 VDC to 1000 VDC.)
Total Output Power						
Continuous Output Power	P_{OUT}			4	W	V_{IN} of 50 VDC.
Continuous Output Power	P_{OUT}			35	W	V_{IN} of 100 VDC.
Continuous Output Power	P_{OUT}			48	W	V_{IN} of 200 VDC.
Continuous Output Power	P_{OUT}			60	W	V_{IN} 300 VDC to 1000 VDC.
Ambient Temperature	T_{AMB}	-40		85	ºC	Inside Inverter.

3   Schematic

Figure 3 – Schematic.

4   Circuit Description

4.1   *INN3949CQ IC Primary*

One end of the transformer primary is connected to the DC bus, the other is connected to the integrated power MOSFET inside the INN3949CQ IC (U1). High-voltage ceramic capacitors C1A, C1B and C1C are used for the decoupling capacitors for the DC input voltage, and a low-cost RCD clamp formed by D1, R1, R2, R3, R4 and C2 limits the peak Drain voltage due to transformer leakage inductance effect.

The IC is self-starting, using an internal high-voltage current source to charge the BPP pin capacitor, C4, when DC input voltage is first applied. During normal operation the primary-side block is powered from an auxiliary winding on the transformer. The output is configured as a flyback winding, which is rectified and filtered using diode D2 and capacitor C3, fed the BPP pin capacitor via a current limiting resistor R5.

In this design the input primary under and overvoltage features were disabled by connecting the V pin to source.

4.2   *INN3949CQ IC Secondary*

The secondary-side of the INN3949CQ IC provides output voltage, output current sensing, and drive a MOSFET providing synchronous rectification.

The 24 V output rectification is provided by SR FETs Q1 and Q2. Low ESR capacitors, C9, C10, C11, C13, C14 and output inductor L1 provide filtering. RC snubber network comprising D4, R7, R8, and C5 for Q1 and Q2 damps high frequency ringing across SR FETs, which results from leakage inductance of the transformer windings and the secondary trace inductances. The gates of Q1 and Q2 are turned on based on the winding voltage sensed via R6 and the FWD pin of the IC. Capacitor C16 is used to suppress high frequency spikes on the FWD pin. In continuous conduction mode operation, the power MOSFET is turned off just prior to the secondary-side controller commanding a new switching cycle from the primary. In discontinuous mode the MOSFET is turned off when the voltage drop across the MOSFET falls below ground. Secondary-side control of the primary-side MOSFET ensures that it is never on simultaneously with the synchronous rectification MOSFET. The MOSFET drive signal is output on the SR pin. A gate enhancement circuit comprising D3, R13 and Q3 prevents Vgs to turn-on during primary turn-ons. The secondary-side of the IC is self-powered from either the secondary winding forward voltage or the output voltage. The output voltage powers the device, fed into Zener VR1 which is connected to the VO pin. Zener VR1 is used to reduce the voltage stress on the VO pin. It will charge the BPS pin capacitor C6 via an internal regulator. The OVP sensing circuit, R14, VR2 and D5, connected to BPS pin provides secondary-side overvoltage protection.

Resistors R9 and R10 form a voltage divider network that senses the output voltage. INN3949CQ IC has an internal reference of 1.265 V. Capacitor C7 provides decoupling from high frequency noise affecting power supply operation, and C8 and R11 is the feedforward network to speed up the response time to lower the output ripple. The output current is sensed by R12 and filtered by C17 with a threshold of approximately 35 mV to reduce losses. Once the current sense threshold across this resistor is exceeded, the device will go into auto-restart.

5   PCB Layout

Layers: 4
Board Thickness: 0.062"
Board Material: FR4
Copper Weight: 2 oz
Surface finish: LF HASL

7.2   Electrical Specification

Parameter	Condition	Spec.
Electrical Strength	60 seconds, 10 mA, from pins 1-6 to FL1 & FL2.	3000 VAC
Nominal Primary Inductance	Measured at 1 V_{PK-PK}, 100 kHz switching frequency, between pin 1 and 2, with all other windings open.	1735 μH ±5%
Resonant Frequency	Between pin 1 and 2, other windings open.	550 kHz (Min.)
Primary Leakage Inductance	Between pin 1 and 2, with pins: FL1-FL2 shorted.	30 μH (Max.)

7.3   Materials List

Item	Description
[1]	Core: PQ26/25 – TDK PC95.
[2]	Bobbin: PQ26/25 – Vertical – 12 pins (6/6); PI#: 25-00055-00; or Equivalent.
[3]	Magnet Wire: #30 AWG, Double Coated.
[4]	Magnet Wire: #31 AWG, Double Coated.
[5]	Magnet Wire: #23 AWG, Triple Insulated Wire.
[6]	Bus Wire: #28 AWG, Alpha Wire, Tinned Copper.
[7]	Tape: 3M 13450-F, Polyester Film, 1 mil Thickness, 13.5 mm Width.
[8]	Varnish: Dolph BC-359.

### 7.5 **Transformer Instruction**
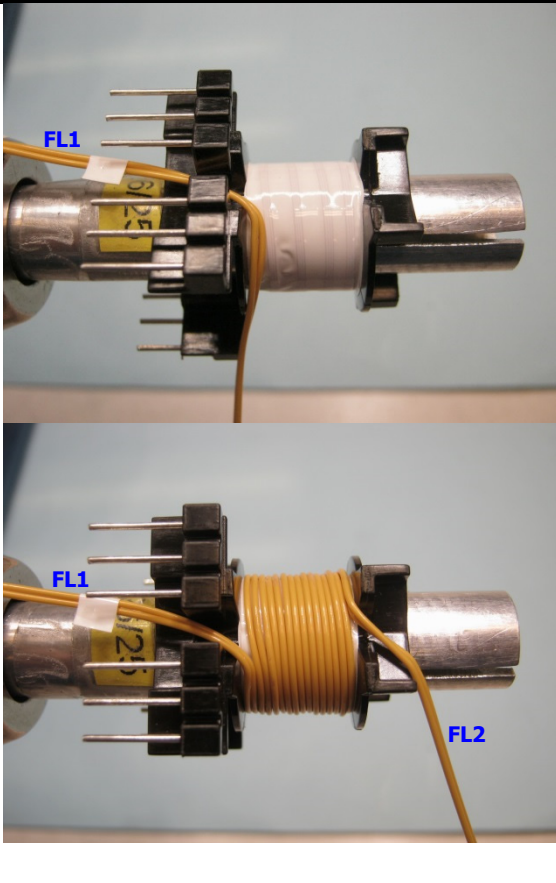

|	
Winding Preparation	Position the bobbin Item [2] on the mandrel such that the primary side of the bobbin is on the left side. Winding direction is clockwise direction.
WD1 1st Primary	Start at pin 1, wind 43 turns of wire Item [3] with tight tension, from left to right, and place 1 layer of tape Item [7]. Continue wind another 40T from right to left, at the last turn, terminate this wire at pin 2.
Insulation	1 layer of tape Item [7].
WD2: Bias & WD3: Shield	Use 2 wires Item [4] start at pin 5 for Bias winding, also use 2 wires same Item [4] start at pin 4 for Shield winding. Wind all 4 wires in parallel and together; spread the wires evenly on the bobbin. At the 4th turn: - bring 2 wires for Bias winding to the left and terminate at pin 4, - cut short 2 wires for Shield Winding as No-Connect.
Insulation	1 layer of tape Item [7].
WD4 Secondary	Start at left slot of secondary side of bobbin, use 2 wires Item [5] leaving ~1", mark as FL1, and wind 8 turns with tight tension. At the last turn, exit the wire at the right slot, also leaving ~ 2" and mark as FL2.
Insulation	Place 2 layers of tape Item [7].
WD5 Secondary	Repeat same winding above and on top, also start as FL1 and end FL2.
Insulation	Place 1 layer of tape Item [7], bring 4 wires floating FL2 from Secondary – WD3 to left slot and continue placing another 2 layers of tape to secure these wires and all the windings.
Finish	Gap core halves to get 1735 µH. Use 2" of bus wire Item [6], solder to pin 4 then lean along core halves and secure with tape. Remove pins 3, 7, 8, 9, 10, 11 & 12. Varnish with Item [8].

7.6   *Winding Illustrations*

Winding Preparation		Position the bobbin Item [2] on the mandrel such that the primary side of the bobbin is on the left side. Winding direction is clockwise direction.
WD1: Primary		Start at pin 1, wind 43 turns of wire Item [3] with tight tension, from left to right, and place 1 layer of tape Item [7]. Continue wind another 40T from right to left, at the last turn, terminate this wire at pin 2.

	TERMINATE at PIN 2	
Insulation		1 layer of tape Item [7].

WD2: Bias & WD3: Shield	Pin 4 Pin 5 for shield winding for bias winding NC	Use 2 wires Item [4] start at pin 5 for Bias winding, also use 2 wires same Item [4] start at pin 4 for Shield winding. Wind all 4 wires in parallel and together; spread the wires evenly on the bobbin. At the 4th turn: - bring 2 wires for Bias winding to the left and terminate at pin 4, - cut short 2 wires for Shield Winding as No-Connect.

Insulation		1 layer of tape Item [7].
WD4 Secondary		Start at left slot of secondary side of bobbin, use 2 wires Item [5] leaving ~1", mark as FL1, and wind 8 turns with tight tension. At the last turn, exit the wire at the right slot, also leaving ~2" and mark as FL2.

Insulation		Place 2 layers of tape Item [7].
WD5 Secondary		Repeat same winding above and on top, also start as FL1 and end FL2.
Insulation		Place 1 layer of tape Item [7], bring 4 wires floating FL2 from Secondary – WD3 to left slot and continue placing another 2 layers of tape to secure these wires and all the windings.

Finish		Gap core halves to get 1735uH. Use 2" of bus wire Item [6], solder to pin 4 then lean along core halves and secure with tape. Remove pins 3, 7, 8, 9, 10, 11 & 12. Varnish with Item [8].

9.7   *Output Ripple Measurements*

For DC output ripple measurements, a modified oscilloscope test probe must be utilized to reduce spurious signals due to pick-up. Details of the probe modification are provided in the Figures below.

The 4987BA probe adapter is affixed with once capacitor tied in parallel across the probe tip. The capacitor includes one (1) 1 µF/50 V ceramic type.
Figure 42 – Oscilloscope Probe Prepared for Ripple Measurement. (End Cap and Ground Lead Removed.)
Figure 43 – Oscilloscope Probe with Probe Master (www.probemaster.com) 4987A BNC Adapter.
(Modified with wires for ripple measurement, and one parallel decoupling capacitor added)

Temperature of Transformer: 71.1 ºC.
Ambient Temperature: 25.7 ºC.
Figure 89 – 1000 VDC 2.5 A Full Load.
Temperature of INN3947CQ: 83.8 ºC.
Temperature of SR FET1 (Q2): 82.6 ºC.
Temperature of SR FET2 (Q3): 82.5 ºC.
Temperature of Transformer: 76.3 ºC.
Ambient Temperature: 26.4 ºC.

10.1 *Temperature vs. Output Power*

Data below is taken with no additional thermal mitigation.

Available output power at elevated ambient can be increased by providing a thermal path from the PCB area connected to the SOURCE pin of the InnoSwitch3-AQ to a surface that is lower in temperature. This is typically the outer wall of the inverter or internally above the water channel cooling the power modules. A very simple approach is a compliant thermal pad (e.g. TGP 1500 from Berquist) placed between the PCB and bottom or top surface of the enclosure.

In the design of the cast enclosure features may be added at no cost to provide a location to place the pad for manufacturing simplicity and reduce the thickness of pad needed to reduce cost of pad needed.

10.2 *Maximum Output Power vs. Ambient Temperature*

(Based on 125 ºC junction temperature of INN3949CQ)

Data below is taken with no additional thermal mitigation
Figure 90 – Maximum Output Power vs. Ambient Temperature.

11 Revision History

Date	Author	Revision	Description & Changes	Reviewed
17-Jan-22	JMR	1.0	Initial Release	Mktg & Apps
10-Feb-23	KM	1.1	Added Supplier for T1	Mktg & Apps
